

Grupo Televisa Statement on Energy Management

This Statement defines the approach we adopt as a Company towards energy management. At Grupo Televisa, we acknowledge the importance of energy management, as energy is one of the main sources of our environmental impact.

Our Environmental Management Policy has the objective of regulating activities carried out by Grupo Televisa in order to mitigate or compensate for its environmental impact. Environmental management is the set of actions the Company carries out in order to reduce energy consumption among other objectives. These actions are evaluated using national and international environmental standards.

We monitor fuel and electricity consumption from the company and its subsidiaries. Fuel consumption comes from the following sources: gasoline, diesel, as well as natural and LP gas. Gasoline is used in staff transportation to the Santa Fe, San Angel and Chapultepec facilities; diesel is used in emergency generators and other different services; natural gas is used in machines such as stoves, ovens, and heaters; and LP gas is used mainly in the employees' dining room.

In Grupo Televisa, we are committed to introducing renewable energy into our operations in order to contribute to the National goal of reaching 35% of clean energy generation by 2024. As well as to the Sustainable Development Goal (SDG) number seven, regarding fostering the use and access to affordable, reliable, sustainable and modern energy for all. In 2017, we started the power trigeneration plant in San Angel, which is a renewable energy project that utilizes the energy contained in the operations fuel by reintegrating it into the process, or into other operating processes.
